In this report, we highlight our fixed income positioning strategies for the second quarter.

Duration

- In the last three months, the tone of the Bank of Canada's (BoC) monetary policy has changed dramatically, with COVID-19 concerns landing on North American shores. What seemed like an outlier event in January quickly became a reality as most of North America remains in self-isolation, putting a clamp down on demand.
- In an attempt to kick-start demand, both the U.S. Federal Reserve (Fed) and the BoC made a number of emergency rate cuts between regular meetings to effectively bring its overnight rate to zero or "near-zero." Both central banks introduced quantitative easing programs, with the BoC making this move for the first time in history.
- Both the Fed and the BoC's bond-buying program took rates lower across the yield curve, but the short-end moved notably lower as a result of the emergency rate cuts. The yield curve has now steepened over the last three months on a combination of rate cuts and a period of treasury selling, as investors looked to fund liquidity by any means possible in mid-March.
- The bond-buying programs may lead to an eventual flattening of the curve, but risk-taking behaviour may lead to a rise in long bond yields as investors eventually move into riskier assets such as equities, especially as valuations become increasingly attractive.

Credit

- The sell-off in the bond market is best characterized as a liquidity funding event. As low interest rates persisted throughout the last decade, investors have been enticed to use leverage. With a global sell-off, however, margin calls were quickly triggered, which has driven investors to move to cash, with fund redemptions prevalent across the asset management industry.
- In the fixed income market, investors looked to fund liquidity through more liquid assets, which resulted in higher-quality investment-grade bonds amassing an unfair share of the selling activity. Interestingly, during the height of the market decline between March 9 and 20, U.S. investment-grade bonds underperformed both U.S. high-yield bonds and the S&P 500 Composite.
- The sell-off in investment-grade bonds was a result of investors wanting to source liquidity through higher-quality debt. As bond dealers reach capacity on their balance sheets, some high-quality bonds went "no-bid," or bid well below fundamental values. This has created a buying opportunity for higher-quality credit, especially for higher-rated A-and above bonds on the shorter-end of the curve (1-10 Years).
- CDX HY spreads currently sit at 778 basis points (bps), while CDX IG spreads sit at 129bps; both the widest levels since 2011. In Canada, we experienced a similar credit spread widening, which was also impacted by lower oil prices. Canadian AAA/AA credit spreads are currently 140bps above Federal bonds, while BBB spreads are 315bps above, the widest since December 2008.
- We continue to believe there is an opportunity to take advantage of pricing dislocations in the market, particularly with bonds rated A and higher. This also allows investors to protect themselves from any credit downgrade that may arise if lock-ups persist longer than expected.

Currency

- The US dollar has seen a tremendous run, gaining 4.89% in March. The gain was larger intra-month, until major central banks co-ordinated swap lines to ensure a US dollar shortage would not ensue. Its direction in Q2 will be largely dependent on whether Europe and North America will be able to "flatten the curve" in their infection rates. We believe US dollar exposure provides a hedge, should markets head even lower.

Individuals should seek the advice of professionals, as appropriate, regarding any particular investment. Investors cannot invest directly in an index.

BMO ETFs are managed and administered by BMO Asset Management Inc., an investment fund manager and portfolio manager, and separate legal entity from Bank of Montreal.

Commissions, management fees and expenses (if applicable) all may be associated with investments in exchange traded funds. Please read the ETF Facts or prospectus before investing. The indicated rates of return are the historical annual compounded total returns including changes in unit value and reinvestment of all dividends or distributions and do not take into account sales, redemption, distribution or optional charges or income taxes payable by any unitholder that would have reduced returns. Exchange traded funds are not guaranteed, their values change frequently and past performance may not be repeated.

For a summary of the risks of an investment in the BMO ETFs, please see the specific risks set out in the prospectus. BMO ETFs trade like stocks, fluctuate in market value and may trade at a discount to their net asset value, which may increase the risk of loss. Distributions are not guaranteed and are subject to change and/or elimination.
